

Name: _____

Date: _____

Solve each problem. Show your work in the box.

Write your final answer on the answer line (or in the blanks shown).

Use the strategies you learned in Lesson 5.14.02.

1 Distance = Rate × Time

A train travels at 90 km/h for 3 hours.

How far does it travel?

$$90 \times 3 = 270 \text{ km. } \underline{\hspace{2cm}}$$

2 Find the Time

A cyclist rides at 15 km/h and needs to travel 60 km.

How many hours will the trip take?

$$60 \div 15 = 4 \text{ hours. } \underline{\hspace{2cm}}$$

3 Find the Rate

Mira drives 315 km in 5 hours.

What is her average speed in km/h?

$$315 \div 5 = 63 \text{ km/h. } \underline{\hspace{2cm}}$$

4 Two-Part Journey

Leo drives at 60 km/h for 2 hours, then at 80 km/h for 1.5 hours.

What is the total distance?

Part 1: $60 \times 2 = 120$ km. Part 2: $80 \times 1.5 = 120$ km. Total = 240 km.

5 Reasoning: Meeting in the Middle

Two trains start from cities 360 km apart and travel toward each other. Train A goes 80 km/h; Train B goes 100 km/h.

After how many hours will they meet?

Combined rate = $80 + 100 = 180$ km/h. Time = $360 \div 180 = 2$ hours.
